The background features a large, semi-transparent watermark of the NPTEL logo. It consists of a circular emblem with a stylized flower or star in the center, surrounded by a ring of rectangular blocks. Below the emblem, the word "NPTEL" is written in large, bold, sans-serif capital letters.

NPTEL MOOC, JAN-FEB 2015  
Week 8, Module 7

# DESIGN AND ANALYSIS OF ALGORITHMS

Intractability: P and NP

MADHAVAN MUKUND, CHENNAI MATHEMATICAL INSTITUTE  
<http://www.cmi.ac.in/~madhavan>

# Checking algorithms

- \* Checking algorithm  $C$  for problem
- \* Takes in an input instance  $I$  and a solution “certificate”  $S$  for  $I$
- \*  $C$  outputs yes if  $S$  represents a valid solution for  $I$ , no otherwise

NPTTEL

# The class NP

- \* Checking algorithm  $C$  that verifies a solution  $S$  for input instance  $I$  runs in time polynomial in  $\text{size}(I)$
- \* Factorization, satisfiability, travelling salesman, vertex cover, independent set, ... are all in NP
- \* If we convert an optimization problem to a checking problem by providing a bound, we add only a log factor for binary search through solution space

# Why “NP”

- \* Non-deterministic Polynomial time
- \* “Guess” a solution and check it
- \* Origins in computability theory
  - \* Non-deterministic Turing machines ...

NPTTEL

# P and NP

- \* P is the class of problems with regular polynomial time algorithms (worst-case complexity)
- \* P is included in NP — generate a solution and check it!
- \* Is  $P = NP$ ?
  - \* Is efficient checking same as efficient generation?
  - \* Intuitively this should not be the case

# $P \neq NP?$

- \* A more formal reason to believe this?
- \* Many “natural” problems are in NP
  - \* Factorization, satisfiability, travelling salesman, vertex cover, independent set, ...
- \* These are all inter-reducible
  - \* Like vertex cover, independent set
- \* If we can solve one efficiently, we can solve them all!

# Boolean satisfiability

- \* Boolean variables  $x, y, z, \dots$
- \* Clause — disjunction of literals,  $(x \parallel !y \parallel z \parallel \dots \parallel w)$
- \* Formula — conjunction of clauses,  $C \& D \& \dots \& E$
- \* 3-SAT — each clause has at most 3 literals

NPTTEL

# Reducing SAT to 3-SAT

- \* Consider a 5 literal clause  $(v \vee !w \vee x \vee !y \vee z)$
- \* Introduce a new literal and split the clause
  - \*  $(v \vee !w \vee \mathbf{a}) \wedge (!\mathbf{a} \vee x \vee !y \vee z)$
  - \* This formula is satisfiable iff original clause is
- \* Repeat till all clauses are of size 3 or less
  - \*  $(v \vee !w \vee \mathbf{a}) \wedge (!\mathbf{a} \vee x \vee \mathbf{b}) \wedge (!\mathbf{b} \vee !y \vee z)$
- \* If SAT is hard, so is 3-SAT

# 3-SAT to independent set

- \* Construct a graph from a 3-SAT formula

$$(!x \parallel y \parallel !z) \& (x \parallel !y \parallel z) \& (x \parallel y \parallel z) \& (!x \parallel !y)$$

- \* Independent set picks one literal per clause to satisfy
  - \* Edges enforce consistency across clauses
- \* Ask for size of independent set = number of clauses

# Reductions within NP

- \* SAT  $\rightarrow$  3-SAT, 3-SAT  $\rightarrow$  independent set, independent set  $\leftrightarrow$  vertex cover
- \* Reduction is transitive, so SAT  $\rightarrow$  vertex cover, ...
- \* Other inter-reducible NP problems
  - \* Travelling salesman, integer linear programming
  - ...
- \* All these problems are “equally” hard

# NP-Completeness

## Cook-Levin Theorem

- \* Every problem in NP can be reduced to SAT
- \* Original proof is by encoding computations of Turing machines
- \* Can replace by encoding of any “generic” computation model — boolean circuits, register machines ...

# NP-Completeness

- \* SAT is said to be **complete** for NP
  - \* It belongs to NP
  - \* Every problem in NP reduces to it
- \* Since SAT reduces to 3-SAT, 3-SAT is also NP-complete
- \* In general, to show P is NP-complete, reduce some existing NP-complete problem to P

# $P \neq NP?$

- \* A large class of practically useful problems are NP-complete
  - \* Scheduling, bin-packing, optimal tours ...
- \* If one of them has a solution in P, all of them do
- \* Many smart people have been working on these problems for centuries
  - \* Empirical evidence that NP is different from P
  - \* But a formal proof is elusive, and worth \$1 million!
